

Fork Positioner for Forklift

Forklift Fork Positioners - The fork positioner is actually a hydraulic apparatus which allows the driver to be able to maneuver the forklift without leaving the seat. They are constructed out of top quality materials and are designed to be able to endure the most difficult procedures and work environments. Side shifting models have the added ability to laterally position the arms or the entire load in order to facilitate much more precise lifting and position in a faster and much more effective method.

The unique fork pocket design could enable operators to be able to securely swing the unit's forks without any worry of destroying the positioning cylinders. This can allow the operator the alternative to either perform independent or simultaneous blade movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into fork positioners on available units.
